A YEAR IN THE ORCHARD
Apples grow.

In the summer, apple trees have many leaves. The leaves play an important role in capturing energy from the sun. This energy is used to convert gases and water into food, helping the trees and small apples begin to grow.

Once pollinated, blossoms fall to the ground and small apples begin to grow.

In the fall, trees are full of ripe apples. It is harvest time. Workers pick the apples by hand. Some orchards allow customers to pick their own apples.

Bees carry pollen from one flower to the next. When the pollen from one blossom makes contact with the stigma of another blossom, an apple begins to grow. Blossoms can also be pollinated by other insects or the wind.
